Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 integrin - and related grafted antibodies based on murine monoclonal

PT LM609, also related nucleic acid, used to treat, prevent or diagnose
 PT angiogenesis or restenosis

XX
 PS Claim 46; Fig 2b; 129pp; English.

XX
 CC This sequence represents the LM609 antibody variable light chain region.
 CC LM609 and the antibody vitaxin bind selectively to integrin alphavbeta3
 CC and can be used to inhibit binding of alphavbeta3 to a ligand and thus
 CC block integrin-mediated signal transduction. This is useful in the
 CC treatment, prevention and diagnosis of alphavbeta3-mediated disease,
 CC specifically angiogenesis and restenosis (but also e.g. (non-)immune
 CC inflammation, diabetic retinopathy, neovascular glaucoma, cancer,
 CC psoriasis, rheumatoid arthritis, macular degeneration, osteoporosis
 CC etc.). The antibodies contain non-murine framework regions so are
 CC suitable for use in humans. Enhanced types of LM609 have affinity more
 CC than 90 times greater than that of parent the parent antibody.

 PT Production of humanized mouse monoclonal antibodies

XX
 PS Disclosure; Page 49-50; 55pp; English.

XX
 CC This sequence represents the light chain V lambda region of
 CC murine monoclonal antibody LM609. LM609 is directed to integrin
 CC alpha-v beta-3. It selectively promotes apoptosis of vascular
 CC cells that have been stimulated to undergo angiogenesis, making it
 CC a tool for cancer diagnosis and therapy. The invention provides
 CC humanised antibodies, especially humanised LM609. In such humanized
 CC antibodies, a light chain CDR from a mouse antibody such as LM609 is
 CC grafted onto a human light chain, and a heavy chain CDR from a mouse
 CC antibody is grafted onto a human antibody heavy chain to produce
 CC libraries from which a humanised murine antibody having the desired
 CC specificity is selected. By preserving the original CDR sequences
 CC such as the HCDR3 and LCDR3 sequences of LM609 (see Y06371-72), the
 CC humanisation strategy ensures epitope conservation.

 PT Method of resurfacing of rodent antibodies to produce humanised
 PT antibody forms - for producing non-human antibodies with improved
 PT therapeutic efficiency by presenting human surface on V-region
 XX
 PS Example 1; Fig 3A; 230pp; English.
 CC The present sequence is that of the light chain variable (LC VR) region
 CC of murine antibody 3Hm. This sequence was aligned with 11 other known
 CC antibody LC VRs and a set of framework positions of surface exposed amino
 CC acid residues was determined. This information can be used in a method to
 CC determine how to modify a rodent antibody or fragment by resurfacing in
 CC order to produce a humanised rodent antibody. Residues (determined from
 CC alignment) at positions 1, 3, 5, 9, 15, 18, 46, 47, 51, 63, 66, 73, 86,
 CC 87, 111, 115, 116 and 117 are accessible residues. None of the entire
 CC combinations of surface residues in the murine sequences were found in
 CC the human sequences and vice versa. However the residues in individual
 CC positions appear to be conserved.

 XX
 CC The amino acid sequences of the light and heavy chains of the
 CC variable domains from antibodies HHV [HHV-10 Fab-lysosyme complex]
 CC (R38601 and R38608, respectively), MCPC [IgA Fab MCP603-phosphocholine
 CC complex] (R38602-03 and R38609-10, respectively), NEWM [Ig Fab' NEW]
 CC (R38604-05 and R38611, respectively) and KOL [IgG1 KOL] (R38606-07 and
 CC R38612, respectively) may be used to determine an alignment from which
 CC appropriate changes may be made.
 CC Unlike other methods of humanisation, which advocate the
 CC replacement of entire antibody framework regions with those of human
 CC antibodies, this method involves only the introduction of human
 CC residues into those positions not critical for antigen binding.
 CC This ensures that the binding properties of the modified antibody
 CC are not diminished.

PT Depletion of CD5-positive cells in vivo - using anti-CD5 antibodies
PT with humanised variable regions
PS Disclosure; Column 43-44; 77pp; English.
XX XX XX XX XX XX XX XX XX XX XX XX XX XX XX XX XX XX XX
A method has been developed of depleting CD5+ cells in an animal. The method comprises administering a cytotoxic protein containing a modified immunoglobulin (Ig) variable domain, where the protein is an anti-CD5 Ig molecule or an immunoconjugate or fusion protein containing an anti-CD5 Ig molecule, and where the modified Ig variable domain comprises at least one of (a) a modified light chain variable region (see W58478 or W58480), and (b) a modified heavy chain variable region (see W58479 or W58481), where W58478 and W58479 are humanised forms of the H65 light and heavy chain variable domains with low risk amino acid substitutions (i.e. low risk of reducing antigen-binding specificity.) and W58480 and W58481 are humanised forms of the H65 light and heavy chain variable domains with moderate risk amino acid substitutions and are present in humanised H65 antibody he3 (ATCC HB 11206). The method is useful for treating autoimmune diseases, especially systemic lupus erythematosus, rheumatoid arthritis, psoriasis or type I diabetes. The present sequence represents the murine HYH antibody light chain variable domain.

CC	This is the amino acid sequence of the light chain variable region		
CC	(VL) of the anti-human alpha-v beta-3 vitronectin receptor murine		
CC	monoclonal antibody D12, as deduced from isolated cDNA (see		
CC	W71798). D12 VH (see W84093) and VL show sequence similarity to		
CC	Kabat VH subgroup I (see W84095) and Kabat VK subgroup III (see		
CC	W84096), respectively. Humanised VH (see W84097) and VL (see		
CC	W84098) were constructed by combining the framework regions of the		
CC	human V region consensus sequences with complementarity determining		
CC	regions of D12 (keeping some preferred murine framework residues).		
CC	The humanised antibodies are specifically reactive with the human		
CC	alpha-v beta-3 protein receptor and capable of neutralising the		
CC	receptor. They can be used for passive immunotherapy of a disorder		
CC	mediated by the alpha-v beta-3 receptor, e.g. cardiovascular		
CC	disorders or angiogenic-related disorders, such as angiogenesis		
CC	associated with diabetic retinopathy, atherosclerosis and		

CC restenosis, chronic inflammatory disorders, macular degeneration,
CC rheumatoid arthritis and cancer, e.g. solid tumour metastasis, and
CC diseases where bone resorption is associated with pathology such as
CC osteoporosis, hyperparathyroidism, Paget's disease, hypercalcaemia
CC of malignancy, osteolytic lesions produced by bone metastasis, bone
CC loss due to immobilisation or sex hormone deficiency. They can also
CC be used for targeted drug therapy, and for detection and diagnosis.

XX Humanized antibody binding to verotoxin II used for treating Verotoxin
PT producing E. coli -

PS Claim 5; Fig 1b; 59pp; English.

CC This sequence represents the light chain variable region of murine
 CC monoclonal antibody Vm1-1 (MuVtm1-1), an antibody that specifically
 CC binds to the B subunit of verotoxin II (VT2). The invention relates
 CC to humanised antibodies against VT2 that are capable of neutralizing
 CC VT2 and/or VT2 variants. The humanised antibody is a humanized form
 CC of MuVtm1-1 comprising the complementarity determining regions of
 CC MuVtm1-1 and the heavy and light chain variable region frameworks
 CC from the human G4 antibody heavy and light chain frameworks,
 CC provided that at least 1 position selected from L49, H29, H30, H49
 CC and H98 is occupied by the amino acid at the equivalent position of
 CC the MuVtm1-1 antibody heavy or light chain variable region framework.
 CC Such humanized antibodies (see Y52406-07) have an affinity for VT2
 CC that is 3-, 5 or 10-times that of MuVtm1-1. They are used for
 CC treating a patient suffering from, or at risk of, the toxic effects
 CC from VT2 (claimed), especially for treating verotoxin producing
 CC Escherichia coli (VTEC) infection, and haemolytic uraemic syndrome
 CC (HUS).

 XX PT Use of a monoclonal antibody to a tumour-associated antigen - to
 PT induce anti-tumour immunity or elicit an increased immune response
 PT to the antigen
 XX XX
 XX Example 3; Fig 3; 47pp; English.

CC The present invention describes the use of an immunogen (A) to induce
 CC anti-tumour immunity; to elicit an increased immune response to tumour
 CC associated antigen (TAA) and/or to induce an immune response to mutant
 CC or wild-type forms of TAA in mammals. (A) is: (i) a monoclonal antibody
 CC (MAB) to TAA, or its fragment; (ii) a peptide based on a CDR
 CC (complementarity determining region) on the heavy or light chain of MAB
 CC (able to elicit antibodies to TAA); or (iii) a DNA that encodes the
 CC variable (V) region of MAB, in a gene delivery vehicle. The present
 CC sequence represents the variable light chain sequence from anti-p53 MAB
 CC 248. Also described is a method for generating sequence-specific,
 CC anti-DNA antibodies (Ab) by immunising a mammal with a MAB directed to a
 CC domain containing a DNA-binding site of a DNA-binding protein. (A) is
 CC used to treat a wide variety of primary and metastatic cancers,
 CC particularly those where p53 is involved. Ab are used for diagnosis (e.g
 CC to determine critical sequences in animal or plant breeding); to
 CC identify bacteria and other parasites; to determine parentage; in
 CC forensic science; to isolate specific genes for DNA vaccination; in gene
 CC sequencing and cloning; also possibly for activation of selected
 CC therapeutic genes in plants, animals and humans. (A) induce an effective
 CC anti-tumour response without causing harm to the patient. The method
 CC uses (A) to generate anti-TAA by exploiting the anti-idiotypic network.

 - 14: sp.unclassified:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

XX Humanised antibody, Vitaxin, that binds selectively to alphaVbeta3

PT integrin - and related grafted antibodies based on murine monoclonal
PT LM609, also related nucleic acid, used to treat, prevent or diagnose
PT angiogenesis or restenosis
PS Claim 60; Page 41; 129pp; English.
XX
XX W76007-W76040 are protein fragments of the grafted monoclonal antibody
CC LM609 heavy and light chain variable region. LM609 and the antibody
CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
CC inhibit binding of alphavbeta3 to a ligand and thus block
CC integrin-mediated signal transduction. This is useful in the treatment,
CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis, rheumatoid
CC arthritis, macular degeneration, osteoporosis etc.). The antibodies
CC contain non-murine framework regions so are suitable for use in humans.
CC Enhanced types of LM609 have affinity more than 90 times greater than
CC that of parent the parent antibody.

XX

XX Reducing immunogenicity of proteins - by modifying the amino acid

PT sequence of the protein to eliminate potential epitopes for T-cells

PT of a given species

XX

PS Example 5; Fig 25; 77pp; English.

XX

XX The invention relates to a method for the production of non-immunogenic

CC proteins. The method comprises determining at least part of the amino

CC acid sequence of the protein; (b) identifying in the amino acid sequence

CC one or more potential epitopes for T-cells (T-cell epitopes) of the given

CC species; and (c) modifying the amino acid sequence to eliminate at least

CC one of the T-cell epitopes identified in step (b) thereby to eliminate or

CC reduce the immunogenicity of the protein when exposed to the immune

CC system of the given species. A method of analysing a pre-existing protein

CC to predict the basis for immunogenic responses is also provided. The

CC methods can be used particularly for reducing the immunogenicity of

CC immunoglobulins or therapeutic proteins, e.g. streptokinase (SK). The

CC products can be used for diagnosis and therapy. The present sequence

CC represents the protein sequence of de-immunised humanised A33 Vh.

XX Agent contg. antigen-binding domain of human antibody to

PT transforming growth factor beta 1 or 2 - and nucleic acid encoding

PT it, used to neutralise effects of TGF, e.g. for control of fibrosis,

PT immune and inflammatory disease

XX

PS Claim 16; Fig 1c(i); 184pp; English.

XX

XX This polypeptide sequence comprises the VH domain of human scFv

CC antibody 31G9, which is specific for transforming growth factor

CC (TGF) beta-1. It is encoded by a gene (T60382) obtained from a

CC CDR3 spiking experiment. The antigen-binding domains of human

CC antibodies (see W15522-40) to TGF beta-1 and/or beta-2 can be

CC used to counter the adverse effects of TGF beta, such as (i)

CC promotion of fibrosis (in dermal, ocular or keloid scarring, lung

CC fibrosis, arterial injury, proliferative retinopathy, retinal

CC detachment, adult respiratory distress syndrome, liver cirrhosis,

CC post myocardial infarction, post-angioplasty restenosis,

CC scleroderma, vascular disorders, cataract, glaucoma, or esp. neural

CC scarring and glomerulonephritis, also (not claimed) osteoporosis,

CC or (ii) immune and inflammatory diseases (e.g. rheumatoid

CC arthritis, macrophage deficiency diseases or macrophage pathogen

CC infection). Nucleic acids encoding human antibody VH and VL can be

CC used for prodn. of recombinant antigen-binding domains. These are

CC highly specific, have low dissociation constants (pref. less than 5

CC nM) and low IC50s for neutralisation.

XX PT Improved method for antibody treatment - uses an antibody comprising
an Old World monkey variable region and a human constant domain

XX PS Example 1; Fig 9c; 84pp; English.

XX CC This sequence represents the VH3 domain of an anti-CD4 antibody
(Ab). This sequence can be used in the method of the invention for
treating a subject, where the treatment comprises administration of an
Ab. The method comprises the administration of an antibody which has an
Old World monkey (e.g. baboon or macaque) variable region which binds to
an antigen (Ag) (or Ag binding portion), and a human constant domain. The
method is useful for the treatment of eczema and immuno-modulated
diseases and especially rheumatoid arthritis. The recombinant antibodies
used are sufficiently different from native monkey antibodies to allow
human antigens to raise these antibodies, but similar enough to human
antibody so there is no immune response to the antibodies in humans.
XX CC Compared to antibodies used in therapy in prior art, these antibodies do
not induce human anti-antibodies on repeated administration. They also
have longer half-lives and do not have a lack of effector function with
human cells.

XX Chimeric monoclonal antibodies - contain anti-human fibrin

PT antibody light and heavy chain variable and constant for treating

PT thrombotic conditions e.g. myocardial infarction

XX Example; Figure 11; 87pp; English.

XX Plasmid pTB1373 contains the whole length of a mouse-human

CC chimeric anti-human fibrin heavy chain cDNA open reading

CC frame. It was prepd. using Poly(A)+ RNA from the anti-fibrin

CC chimeric Ab-producing transformant FIB1-H01/X63 as a template

CC to clone human C-kappa cDNA, using the oligo-dT (Pharmacia) primer as

CC a primer for first strand cDNA synthesis and the 5'C2H and 3'EH

CC primers for the PCR. A human gamma-1 chain CH2-CH3 domain encoding

CC cDNA was amplified. Similarly a human gamma-1 chain CH1 domain

CC encoding cDNA and an anti-fibrin antibody VH cDNA and a leader

CC peptide cDNA were amplified using the primers 3'EH, 3'C2H and 3'CIH

CC respectively as a primer for first strand cDNA synthesis and the

CC primer combination of 5'CIH and 3'C2H, of 5'LIH and 3'CIH and of

CC 5'SH and 3'LIH respectively as primers for PCR. The amplified gene

CC products were isolated and used to produce plasmids. After

CC confirmation of the cDNA sequence of each plasmid, the cDNA

CC encoding LH, VH, CH1 and CH2CH3 were joined together to give

CC plasmid pTB1373 contg. the whole length chimeric H chain

CC (LH, VH, CH1, CH2CH3), also abbreviated as Igh-FIB,

PT Humanised form of murine monoclonal antibody MAB 15 - useful for
PT treating lung cancer
PT
XX
PS Claim 2; Fig 12; 71pp; English.
XX
CC This polypeptide comprises the heavy chain variable region VH
CC of humanised reshaped monoclonal antibody (MAB) 15 comprising
CC complementarity determining regions of murine MAB 15 (DSM ACC2117),
CC and reshaped human 30p1 framework regions. It is expressed by a
CC cDNA clone (see W72237) prepared using PCR mutagenesis methods. A
CC claimed process for preparation of humanised reshaped MAB 15
CC involves: cloning and sequencing murine MAB 15 VL and VH regions
CC (see W21653 and W21654); constructing, expressing and analysing
CC chimeric MAB 15 antibody (see W21655-56); modelling the structure
CC of murine MAB 15 variable regions; designing reshaped human MAB 15
CC variable regions; preparing an oligonucleotide sequence which codes
CC for the constant regions of the light and heavy chain of a human
CC immunoglobulin; and constructing, expressing and analysing the
CC complete reshaped human MAB 15. The humanised MAB can be used for
CC treating tumours, especially lung cancer, and for the manufacture
CC of a drug related to tumours, especially lung cancer.

 XX
 CC This sequence represents the heavy chain variable region of murine
 CC monoclonal antibody LM609. LM609 is directed to integrin
 CC alpha-v beta-3. It selectively promotes apoptosis of vascular
 CC cells that have been stimulated to undergo angiogenesis, making it
 CC a tool for cancer diagnosis and therapy. The invention provides
 CC humanised antibodies, especially humanised LM609. In such humanized
 CC antibodies, a light chain CDR from a mouse antibody such as LM609 is
 CC grafted onto a human light chain, and a heavy chain CDR from a mouse
 CC antibody is grafted onto a human antibody heavy chain to produce
 CC libraries from which a humanised murine antibody having the desired
 CC specificity is selected. By preserving the original CDR sequences
 CC such as the HCDR3 and LCDR3 sequences of LM609 (see Y06371-72), the
 CC humanisation strategy ensures epitope conservation.

 DR Recombinant and humanised chimeric antibodies against human
 XX interleukin-1-beta - for preventing and treating
 PT interleukin-mediated inflammatory disorders
 XX Claim 5; Page 36-37; 62pp; English.
 XX Amino acid sequences of the heavy chain (W11917) and light chain
 CC (W11918) of anti-human interleukin-1 beta (IL-1 beta) murine
 CC monoclonal antibody (MAb) SK48-E26 were deduced from nucleic acids
 CC (T51436-37) derived from hybridoma SK48-E26. The heavy and light
 CC chains, esp. the complementarity determining region sequences,
 CC can be utilised in novel recombinant chimeric and humanised
 CC antibodies (see also W11919-20) useful for the treatment and

CC Prevention of IL-1 mediated inflammatory disorders.

 DE 1-PHOSPHATIDYLINOSITOL PHOSPHOTERASE PRECURSOR (EC 3.1.4.10)
 DE (PHOSPHATIDYLINOSITOL-SPECIFIC PHOSPHOLIPASE C) (PI-PLC).
 GN PLC.
 OS Staphylococcus aureus.
 CC Bacteria; Firmicutes; Bacillus/Clostridium group;
 CC Bacillus/Staphylococcus group; Staphylococcus.
 RN [1]
 RP SEQUENCE FROM N.A.
 RC STRAIN-NEWMAN;
 RX MEDLINE; 94041628.
 RA Daugherty S.; Low M.G.;
 RT "Cloning, expression, and mutagenesis of
 RT phosphatidylinositol-specific phospholipase C from Staphylococcus
 RT aureus: a potential staphylococcal virulence factor."
 RL Infect. Immun. 61:5078-5089(1993).

CC -!- FUNCTION: CLEAVES GLYCOSYLPHOSPHATIDYLINOSITOL (GPI) AND
 CC PHOSPHATIDYLINOSITOL (PI) ANCHORS BUT NOT PI PHOSPHATES. POTENTIAL
 CC VIRULENCE FACTOR.
 CC -!- CATALYTIC ACTIVITY: 1-PHOSPHATIDYL-D-MYO-INOSITOL = D-MYO-INOSITOL
 CC 1,2-CYCLIC PHOSPHATE + DIACYLGLYCEROL.
 CC -!- SUBCELLULAR LOCATION: SECRETED.
 CC -!- SIMILARITY: TO OTHER BACTERIAL PI-PLC.
 CC -!- SIMILARITY: DOMAIN X IS CONSERVED IN DIFFERENT FORMS OF PLC AND IS
 CC ESSENTIAL FOR CATALYTIC ACTIVITY.

XX Reducing immunogenicity of proteins - by modifying the amino acid
 PT sequence of the protein to eliminate potential epitopes for T-cells
 PT of a given species

PS Example 5; Fig 25; 77pp; English.

XX The invention relates to a method for the production of non-immunogenic
 CC proteins. The method comprises determining at least part of the amino
 CC acid sequence of the protein; (b) identifying in the amino acid sequence
 CC one or more potential epitopes for T-cells (T-cell epitopes) of the given
 CC species; and (c) modifying the amino acid sequence to eliminate at least
 CC one of the T-cell epitopes identified in step (b) thereby to eliminate or
 CC reduce the immunogenicity of the protein when exposed to the immune
 CC system of the given species. A method of analysing a pre-existing protein
 CC to predict the basis for immunogenic responses is also provided. The
 CC methods can be used particularly for reducing the immunogenicity of
 CC immunoglobulins or therapeutic proteins, e.g. streptokinase (SK). The
 CC products can be used for diagnosis and therapy. The present sequence
 CC represents the protein sequence of de-immunised humanised A33 Vh.

XX Hanna N, Newman RA, Raab RW;

XX WPI; 1998-296690/26.

XX Improved method for antibody treatment - uses an antibody comprising
 PT an Old World monkey variable region and a human constant domain

PS Example 1; Fig 9c; 84pp; English.

XX This sequence represents the VH3 domain of an anti-CD4 antibody for
 CC (AB). This sequence can be used in the method of the invention for
 CC treating a subject, where the treatment comprises administration of an
 CC Ab. The method comprises the administration of an antibody which has an
 CC Old World monkey (e.g. baboon or macaque) variable region which binds to
 CC an antigen (Ag) (or Ag binding portion), and a human constant domain. The
 CC method is useful for the treatment of eczema and immuno-modulated
 CC diseases and especially rheumatoid arthritis. The recombinant antibodies
 CC used are sufficiently different from native monkey antibodies to allow
 CC human antigens to raise these antibodies, but similar enough to human
 CC antibody so there is no immune response to the antibodies in humans.
 CC Compared to antibodies used in therapy in prior art, these antibodies do
 CC not induce human anti-antibodies on repeated administration. They also
 CC have longer half-lives and do not have a lack of effector function with
 CC human cells.

XX Chimeric monoclonal antibodies - contain anti-human fibrin

XX antibody light and heavy chain variable and constant for treating

XX thrombotic conditions e.g. myocardial infarction

XX Example; Figure 11; 87pp; English.

XX Plasmid pTb1373 contains the whole length of a mouse-human

XX chimeric anti-human fibrin heavy chain cDNA open reading

XX frame. It was prepd. using Poly(A)+ RNA from the anti-fibrin

XX chimeric Ab-producing transformant FIB1-H01/X63 as a template

XX to clone human C-kappa cDNA, using the oligo-dT (Pharmacia) primer as

XX a primer for first strand cDNA synthesis and the 5'C2H and 3'EH

XX primers for the PCR. A human gamma-1 chain CH2-CH3 domain encoding

XX cDNA was amplified. Similarly a human gamma-1 chain CH1 domain

XX encoding cDNA and an anti-fibrin antibody VH cDNA and a leader

XX peptide cDNA were amplified using the primers 3'EH, 3'C2H and 3'CH

XX respectively as a primer for first strand cDNA synthesis and the

CC primer combination of 5'CH and 3'C2H, of 5' LH and 3'CH and of
 CC 5' SH and 3' LH respectively as primers for PCR. The amplified gene
 CC products were isolated and used to produce plasmids. After
 CC confirmation of the cDNA sequence of each plasmid, the cDNA
 CC encoding LH, VH, CH1 and CH2CH3 were joined together to give
 CC plasmid pTB1373 contg. the whole length chimeric H chain
 CC (LH, VH, CH1, CH2CH3), also abbreviated as Igh-FIB,

 XX
 PT Humanised form of murine monoclonal antibody MAB 15 - useful for
 PT treating lung cancer
 XX
 PS Claim 2; Fig 12; 71pp; English.
 XX
 CC This polypeptide comprises the heavy chain variable region VH
 CC of humanised reshaped monoclonal antibody (MAB) 15 comprising
 CC complementarity determining regions of murine MAB 15 (DSM ACC2117),
 CC and reshaped human 30P1 framework regions. It is expressed by a
 CC cDNA clone (see T72237) prepared using PCR mutagenesis methods. A
 CC claimed process for preparation of humanised reshaped MAB 15
 CC involves: cloning and sequencing murine MAB 15 VL and VH regions
 CC (see W21653 and W21654); constructing, expressing and analysing
 CC chimeric MAB 15 antibody (see W21655-56); modelling the structure
 CC of murine MAB 15 variable regions; designing reshaped human MAB 15
 CC variable regions; preparing an oligonucleotide sequence which codes
 CC for the constant regions of the light and heavy chain of a human
 CC immunoglobulin; and constructing, expressing and analysing the
 CC complete reshaped human MAB 15. The humanised MAB can be used for
 CC treating tumours, especially lung cancer, and for the manufacture
 CC of a drug related to tumours, especially lung cancer.

 XX
 XX Humanised antibody, Vitaxin, that binds selectively to alphaVbeta3
 PT integrin - and related grafted antibodies based on murine monoclonal
 PT LM609, also related nucleic acid, used to treat, prevent or diagnose
 PT angiogenesis or restenosis

XX Claim 43; Fig 2a; 129pp; English.

XX This sequence represents the LM609 antibody variable heavy chain region.
 CC LM609 and the antibody vitaxin bind selectively to integrin alphavbeta3
 CC and can be used to inhibit binding of alphavbeta3 to a ligand and thus
 CC block integrin-mediated signal transduction. This is useful in the
 CC treatment, prevention and diagnosis of alphavbeta3-mediated disease,
 CC specifically angiogenesis and restenosis (but also e.g. (non-)immune
 CC inflammation, diabetic retinopathy, neovascular glaucoma, cancer,
 CC psoriasis, rheumatoid arthritis, macular degeneration, osteoporosis
 CC etc.). The antibodies contain non-murine framework regions so are
 CC suitable for use in humans. Enhanced types of LM609 have affinity more
 CC than 90 times greater than that of parent the parent antibody.

XX Production of humanized mouse monoclonal antibodies

XX Disclosure; Page 52-53; 55pp; English.

XX This sequence represents the heavy chain variable region of murine
 CC monoclonal antibody LM609. LM609 is directed to integrin
 CC alpha-v beta-3. It selectively promotes apoptosis of vascular
 CC cells that have been stimulated to undergo angiogenesis, making it
 CC a tool for cancer diagnosis and therapy. The invention provides
 CC humanised antibodies, especially humanised LM609. In such humanized
 CC antibodies, a light chain CDR from a mouse antibody such as LM609 is
 CC grafted onto a human light chain, and a heavy chain CDR from a mouse
 CC antibody is grafted onto a human antibody heavy chain to produce
 CC libraries from which a humanised murine antibody having the desired
 CC specificity is selected. By preserving the original CDR sequences

CC such as the HCDR3 and LCDR3 sequences of LM609 (see Y06371-72), the
 CC humanisation strategy ensures epitope conservation.

XX Reducing immunogenicity of proteins - by modifying the amino acid
 PT sequence of the protein to eliminate potential epitopes for T-cells
 PT of a given species

XX PS Example 6; Fig 27; 77pp; English.

XX The invention relates to a method for the production of non-immunogenic
 CC proteins. The method comprises determining at least part of the amino
 CC acid sequence of the protein; (b) identifying in the amino acid sequence
 CC one or more potential epitopes for T-cells (T-cell epitopes) of the given
 CC species; and (c) modifying the amino acid sequence to eliminate at least
 CC one of the T-cell epitopes identified in step (b) thereby to eliminate or
 CC reduce the immunogenicity of the protein when exposed to the immune
 CC system of the given species. A method of analysing a pre-existing protein
 CC to predict the basis for immunogenic responses is also provided. The
 CC methods can be used particularly for reducing the immunogenicity of
 CC immunoglobulins or therapeutic proteins, e.g. streptokinase (SK). The
 CC products can be used for diagnosis and therapy. The present sequence
 CC represents the protein sequence of de-immunised murine A33 Vh.

XX Reducing immunogenicity of proteins - by modifying the amino acid
 PT sequence of the protein to eliminate potential epitopes for T-cells
 PT of a given species

XX Example 6; Fig 27; 77pp; English.

XX The invention relates to a method for the production of non-immunogenic
 CC proteins. The method comprises determining at least part of the amino
 CC acid sequence of the protein; (b) identifying in the amino acid sequence
 CC one or more potential epitopes for T-cells (T-cell epitopes) of the given
 CC species; and (c) modifying the amino acid sequence to eliminate at least
 CC one of the T-cell epitopes identified in step (b) thereby to eliminate or
 CC reduce the immunogenicity of the protein when exposed to the immune
 CC system of the given species. A method of analysing a pre-existing protein
 CC to predict the basis for immunogenic responses is also provided. The
 CC methods can be used particularly for reducing the immunogenicity of
 CC immunoglobulins or therapeutic proteins, e.g. Streptokinase (SK). The
 CC products can be used for diagnosis and therapy. The present sequence
 CC represents the protein sequence of de-immunised murine A33 Vh.

XX PT Improved method for antibody treatment - uses an antibody comprising
XX an Old World monkey variable region and a human constant domain

XX PS Example 1; Fig 9c; 84pp; English.

XX CC This sequence represents the VH3 domain of an anti-CD4 antibody
CC (Ab). This sequence can be used in the method of the invention for
CC treating a subject, where the treatment comprises administration of an
CC Ab. The method comprises the administration of an antibody which has an
CC Old World monkey (e.g. baboon or macaque) variable region which binds to
CC an antigen (Ag) (or Ag binding portion), and a human constant domain. The
CC method is useful for the treatment of eczema and immuno-modulated
CC diseases and especially rheumatoid arthritis. The recombinant antibodies
CC used are sufficiently different from native monkey antibodies to allow
CC human antigens to raise these antibodies, but similar enough to human
CC antibody so there is no immune response to the antibodies in humans.
CC Compared to antibodies used in therapy in prior art, these antibodies do
CC not induce human anti-antibodies on repeated administration. They also
CC have longer half-lives and do not have a lack of effector function with
CC human cells.

CC produced by the cell line 3C2, an IgG1 with a gamma 1 heavy chain
CC and kappa light chain. The sequence encodes a single chain binding
CC molecule comprising the variable regions of heavy and light chains
CC linked by a peptides. The variable region of each DNA chain was
CC prep'd. by introducing a ClaI site and an initiation codon (atcgatg)
CC prior to the first codon of the mature sequence and a HindIII site
CC and termination codon (taagctt) after codon 123 (heavy chain) or
CC 109 (light chain). The plasmids constructed to contain these
CC portions were pGX3772 and pGX3773 (heavy and light resp.). TRY40
CC has the following polypeptide structure:
CC Met-[LCVR(1-41)]-I-A-K-A-F-K-N-[HCVR(8-115)]-P-G-S-[LCVR(45-109)].

XX Single chain poly:peptide for binding antigen - comprising light

PT and heavy chain antigen binding portions linked by peptide linker

XX Example 1; Figure 24; 78pp; English.

CC The single chain polypeptide is derived from the mature light and
CC heavy chains of a mouse monoclonal antibody (MAb) and has affinity
CC for a given antigen (Bovine growth hormone). It comprises a first
CC polypeptide comprising the antigen binding portion of of the light
CC chain variable region of an antibody and a second polypeptide
CC comprising the antigen binding portion of the heavy chain variable
CC region of an antibody and at least one peptide linker linking the
CC first and second polypeptide chains. The resulting single chain
CC polypeptide can be used in diagnostics, therapy
CC (in vivo and in vitro), imaging, purifications and biosensors.
CC This particular single chain binding molecule was designated TRV40
CC and contains two linker peptides.

XX CC Computer-designed single chain antigen binding molecule TRY61
CC (W02188), encoded by the DNA sequence given in T36460, has the
CC formula Met-(L-chain 1-104)-linker-(H-chain 7-123). The L (light)
CC and H (heavy) chains are from a murine monoclonal antibody (see also
CC R97377 and R97376) specific for bovine growth hormone (BGH). Plasmid
CC PGX3772 (contg. the heavy chain variable region) was cloned into
CC PGX3773 (contg. the light chain sequence) with 2 synthetic
CC oligonucleotides that encoded the linker. The resulting plasmid was
CC inserted into vector PGX3703 and introduced into E. coli. TRY61 was
CC expressed at over 2% of total cellular protein. It was able to
CC bind BGH as effectively as the original monoclonal antibody.

 RP [2].
 RP SEQUENCE OF 1-969 FROM N.A.
 RX MEDLINE; 87163522.
 RA Sumiyoshi H., Morita K., Mori C., Fuke I., Shiba T., Sakaki Y.,
 RA Igarashi A.,
 RT "Sequence of 3000 nucleotides at the 5' end of Japanese encephalitis
 RT virus RNA.";
 RL Gene 48:195-201(1986).
 CC -I- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
 CC HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
 CC NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
 CC -I- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
 CC LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
 CC PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
 CC PROTEIN C AND MRNA.

XX Production of humanized mouse monoclonal antibodies

XX Disclosure; Page 52-53; 55pp; English.

XX This sequence represents the heavy chain variable region of murine
 CC monoclonal antibody LM609. LM609 is directed to integrin
 CC alpha-v beta-3. It selectively promotes apoptosis of vascular
 CC cells that have been stimulated to undergo angiogenesis, making it
 CC a tool for cancer diagnosis and therapy. The invention provides
 CC humanised antibodies, especially humanised LM609. In such humanized
 CC antibodies, a light chain CDR from a mouse antibody such as LM609 is
 CC grafted onto a human light chain, and a heavy chain CDR from a mouse
 CC antibody is grafted onto a human antibody heavy chain to produce
 CC libraries from which a humanised murine antibody having the desired
 CC specificity is selected. By preserving the original CDR sequences
 CC such as the HCDR3 and LCDR3 sequences of LM609 (see Y06371-72), the
 CC humanisation strategy ensures epitope conservation.

XX DNA encoding single-chain antibody molecule - specific for
PT multidrug-resistant tumour cells, useful in diagnosis or therapy
XX
XX Disclosure; Fig 1; 26pp; English.
XX
XX This sequence represents the VH chain of the antibody
CC produced by hybridoma cell line 15D3. It is part of the nucleic acid of
CC the invention which encodes a single-chain antibody molecule (scFv)
CC comprising the heavy-chain complementarity-determining regions (CDRs) of
CC the monoclonal antibody produced by hybridoma cell line 15D3, where the
CC monoclonal antibody and scFv are capable of binding to
CC multidrug-resistant (MDR) human tumour cells. The CDR sequences from both
CC the heavy and light chains (HCDR1, HCDR2, HCDR3, LCDR1, LCDR2, and LCDR3)
CC are all used in an expression cassette that can be used in a method for
CC inducing the production of a polypeptide. The method is useful for
CC producing recombinant scFv, which can be used for diagnosis or therapy
CC (e.g. in the form of an immunotoxin) for MDR tumours.

XX PT Nucleic acids encoding antibody binding sites of immunoglobulins
PT with affinity for cancer antigens useful in cancer therapy
XX PS Disclosure; Fig 1; 27pp; English.
XX CC This sequence is the antibody 15D3 VH chain. The invention relates
CC to isolated nucleic acid molecules comprising complementarity determining
CC regions (CDRs) and framework regions (FRs) from humans and mice encoding
CC a monomeric polypeptide that exhibits the immunological binding
CC properties of an immunoglobulin which binds to a human tumour cell
CC displaying the multiple drug resistance (MDR) phenotype. The recombinant
CC nucleotide sequences can be used to transfect mammalian cells for the
CC expression of recombinant human antibodies which exhibit the antigen
CC specificity of the murine antibody molecule. The polypeptides produced
CC can be used in specific binding assays, affinity purification schemes,
CC drug or toxin targeting, imaging and genetic or immunological
CC therapeutics for various cancers. The CDRs can be used in single chain Fv
CC (scFv) molecules which can be used in the development of retroviral
CC vectors that target human cancer cells expressing the MDR phenotype for
CC gene therapy. The recombinantly veneered murine antigen binding sites
CC consist of the selective replacement of FR residues from a rodent light
CC or heavy chain V region with human FR residues to provide a xenogeneic
CC molecule comprising an antigen binding site which retains substantially
CC all of the native FR polypeptide folding structure. The nucleic acids
CC encode molecules with altered or enhanced antigen-binding capabilities
CC and/or reduced immunogenicity.

 PS
 XX The heavy chain variable region (W11919) and light chain variable
 CC region (W11920) of humanised anti-human interleukin-1 beta (IL-1
 CC beta) murine monoclonal antibody (MAB) SK48-E26 comprise the
 CC complementarity determining regions from MAB SK48-E26 (see also
 CC W11917-18) grafted into human frameworks. The humanised antibody
 CC can be produced in e.g. COS cells transfected with vectors carrying
 CC humanised heavy and light chain nucleic acids (T51437-39) for use
 CC in the treatment and prevention of IL-1 mediated inflammatory
 CC disorders.

 FT XX Recombinant anti-CD22 antibodies and immuno-conjugates - of
 FT PT antibodies linked to a therapeutic agent, e.g. Pseudomonas exotoxin
 FT PT or a label; for inhibiting malignant B-cells
 FT XX Claim 6; Fig 1; 71pp; English.
 FT XX The invention claims for a recombinant immunoconjugate comprising
 CC of a therapeutic agent (e.g Pseudomonas exotoxin) or a detectable
 CC label peptide bonded to a recombinant anti-CD22 antibody (RFB4 IgG)
 CC having the present variable heavy (VH) chain with a cysteine residue
 CC at amino acid 44 and a variable light (VL; W66098) chain with a
 CC cysteine residue at amino acid 100. The immunoconjugate is claimed
 CC to inhibit the growth of malignant B-cells in vivo, such as rodent,
 CC canine or primate B-cells. The anti-CD22 antibody is claimed useful
 CC for detecting CD22 protein in a sample or in vivo in a mammal, and
 CC can be used in diagnostic kits.

 XX
 XX Inhibiting xenograft rejection by modifying antigen expression of
 PT the graft - prevents binding of anti-donor antibody and prolongs
 PT graft survival
 XX
 XX Claim 13; Page 96; 135pp; English.
 XX
 XX A polypeptide (W06208) comprises the variable heavy chain segment
 CC of the LEW rat anti-hamster xenograft monoclonal antibody ID12BF3.
 CC It is encoded by a cDNA clone (T43417) obtd. from a ID12BF3
 CC hybridoma heavy chain cDNA library; the hybridoma was produced by
 CC fusing spleen cells of a LEW rat that had received a hamster heart
 CC transplant, with rat myeloma cells. Recombinant fragments, e.g.

CC Fab'12 and Fab', of the antibody block binding of preformed
CC anti-donor xenograft antibodies in a recipient animal serum to
CC antigen expressed by endothelial cells of the xenograft, i.e. they
CC inhibit antibody-mediated rejection, thereby prolonging the
CC survival of the hamster xenograft in the recipient.

 RT "HDAL and RPD3 are members of distinct yeast histone deacetylase
 RT complexes that regulate silencing and transcription."
 RL Proc. Natl. Acad. Sci. U.S.A. 93:14503-14508(1996).
 CC -1- FUNCTION: RESPONSIBLE FOR THE DEACETYLATION OF LYSINE RESIDUES ON
 CC THE N-TERMINAL PART OF THE CORE HISTONES (H2A, H2B, H3 AND H4).
 CC HISTONE DEACETYLATION PLAYS AN IMPORTANT ROLE IN TRANSCRIPTIONAL
 CC REGULATION AND CELL CYCLE PROGRESSION.
 CC -1- SUBCELLULAR LOCATION: NUCLEAR.

CC -1- SIMILARITY: BELONGS TO THE HISTONE DEACETYLASE / ACUC / APHA
 CC FAMILY.

XX Humanised antibody, Vitaxin, that binds selectively to alphaVbeta3

PT integrin - and related grafted antibodies based on murine monoclonal
 PT LM609, also related nucleic acid, used to treat, prevent or diagnose
 PT angiogenesis or restenosis
 PS
 XX Claim 61; Page 41; 129pp; English.
 CC W76007-W76040 are protein fragments of the grafted monoclonal antibody
 CC LM609 heavy and light chain variable region. LM609 and the antibody
 CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
 CC inhibit binding of alphavbeta3 to a ligand and thus block
 CC integrin-mediated signal transduction. This is useful in the treatment,
 CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
 CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
 CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis, rheumatoid
 CC arthritis, macular degeneration, osteoporosis etc.). The antibodies
 CC contain non-murine framework regions so are suitable for use in humans.
 CC Enhanced types of LM609 have affinity more than 90 times greater than
 CC that of parent the parent antibody.

XX Humanised, semi-chimeric and chimeric antibodies against human
 PT high-affinity IgE receptor - useful medicinally and have low
 PT antigenicity in humans

XX Claim 1; Page 12; 26pp; Japanese.

XX The present complementarity determining region 2 (CDR2), which is
 CC from a murine, anti-human high affinity immunoglobulin E (IgE)
 CC receptor, monoclonal antibody (Mab) heavy chain variable region,
 CC can be used in the preparation of humanised or semi-chimeric

CC anti-human high affinity IgE receptor Mab. The Mab can be used to
 CC treat or prevent diseases, specifically allergies, associated with
 CC the receptor. The humanised, semi-chimeric or chimeric Mab have
 CC very low antigenicity in humans.

 PT of human Fc-epsilon RI

XX Claim 3; Page 13; 20pp; Japanese.

XX Polypeptides which specifically recognise human IgE receptor (Fc-
 CC epsilon-RI) have been isolated and sequenced. The new peptides are
 CC related to a monoclonal antibody against Fc-epsilon RI and are
 CC either heavy or light chain molecules. The heavy chain molecules
 CC have the general formula FRI-CDRIH-FR2-CDR2H-FR3-CDR3H-FR4 (corresp.
 CC to R79153, R79155, R79157, R79159 and R79161) and are encoded by
 CC Q96280, Q96282, Q96284, Q96286 and Q96288. FRI is a polypeptide
 CC having 29-35 amino acids (aa), FR2 is a 10-16 aa polypeptide, FR3 is

CC a 33-35 aa polypeptide and FR4 is a 12-14 aa polypeptide. Similarly
 CC the light chains have the general formula FR5-CDRL1-FR6-CDRL2L-FR7-
 CC CDR3L-FR8, (corresp. to R79154, R79156, R79158, R79160 and R79162)
 CC and are encoded by Q96281, Q96283, Q96285, Q96287 and Q96289. FR5
 CC is a 23-28 aa polypeptide, FR6 is a 14-16 aa polypeptide, FR7 is a
 CC 30-34 aa polypeptide and FR8 is a 9-11 aa polypeptide. All the
 CC peptides are derived from mouse hybridoma cells and are useful in
 CC the detection of the human FC-epsilonRI or for the elucidation of
 CC an antigen recognising region of a monoclonal antibody against
 CC human FC-epsilonRI.

XX Murine/human chimeric monoclonal antibody, chMint5 specific for
 PT EGF-R - shows a lower immunogenicity when administered to humans

XX Claim 7; Page 15; 28pp; English.

XX The amino acid sequence (W00240) of the heavy chain variable region
 CC (VH) of the epidermal growth factor receptor (EGF-R)-specific mouse-
 CC human chimeric antibody chMint5 was deduced from a cDNA clone
 CC (T33445) obtd. by PCR amplification of murine Mint5 hybridoma DSM
 CC ACC2150 cDNA. chMint5 comprises Mint5 VH and VL regions fused
 CC to human C-gamma1 and CK regions. Constructs were expressed in
 CC CHO cell transfectants. chMint5 shows lower immunogenicity than
 CC Mint5 when administered to humans. It can be used in diagnostic
 CC assays or used to produce immunotoxins or immunocytokines useful
 CC for tumour therapy.

XX Humanised form of murine monoclonal antibody MAB 15 - useful for
 PT treating lung cancer

XX Claim 2; Fig 12; 71pp; English.

XX This polypeptide comprises the heavy chain variable region VH
 CC of humanised reshaped monoclonal antibody (MAB) 15 comprising
 CC complementarity determining regions of murine MAB 15 (DSM ACC2117),
 CC and reshaped human 30P1 framework regions. It is expressed by a
 CC cDNA clone (see T72237) prepared using PCR mutagenesis methods. A
 CC claimed process for preparation of humanised reshaped MAB 15
 CC involves: cloning and sequencing murine MAB 15 VL and VH regions
 CC (see W21653 and W21654); constructing, expressing and analysing
 CC chimeric MAB 15 antibody (see W21655-56); modelling the structure
 CC of murine MAB 15 variable regions; designing reshaped human MAB 15
 CC variable regions; preparing an oligonucleotide sequence which codes
 CC for the constant regions of the light and heavy chain of a human
 CC immunoglobulin; and constructing, expressing and analysing the
 CC complete reshaped human MAB 15. The humanised MAB can be used for
 CC treating tumours, especially lung cancer, and for the manufacture
 CC of a drug related to tumours, especially lung cancer.

 XX
 XX Monoclonal anti-idiotypic antibodies mimicking epidermal growth
 PT factor receptor - useful for tumour therapy
 PT
 PS Claim 6; Fig 5E; 28pp; English.
 XX
 CC Murine monoclonal anti-idiotypic antibodies, 15H8, 3B6 and 5A6 are
 CC new. They induce an immune response against epidermal growth factor
 CC receptor (EGFR). The sequences of the heavy and light chain variable
 CC regions of these antibodies are given in the specification. The
 CC antibodies are used for the manufacture of drugs directed against
 CC tumours that express EGFR on their surface, including melanomas,
 CC gliomas and carcinomas.

 PT

XX Claim 6; Page 7; 13pp; Japanese.
 PS
 XX This sequence represents a human antiFc epsilon RI alpha chain antibody,
 CC produced using the method of the invention. The method is for preparing
 CC an antibody Fab fragment using the yeast Pichia pastoris as the host
 CC cell. The method can prepare an antibody Fab fragment cost efficiently
 CC and in high yield.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

XX Production of humanized mouse monoclonal antibodies

XX Disclosure; Page 52-53; 55pp; English.

XX This sequence represents the heavy chain variable region of murine

CC monoclonal antibody LM609. LM609 is directed to integrin

CC alpha-v beta-3. It selectively promotes apoptosis of vascular

CC cells that have been stimulated to undergo angiogenesis, making it

CC a tool for cancer diagnosis and therapy. The invention provides

CC humanised antibodies, especially humanised LM609. In such humanized

CC antibodies, a light chain CDR from a mouse antibody such as LM609 is

CC grafted onto a human light chain, and a heavy chain CDR from a mouse

CC antibody is grafted onto a human antibody heavy chain to produce

CC libraries from which a humanised murine antibody having the desired

CC specificity is selected. By preserving the original CDR sequences

CC such as the HCDR3 and LCDR3 sequences of LM609 (see Y06371-72), the

CC humanisation strategy ensures epitope conservation.

XX PT New polypeptide including sequence from single antibody chain and
 PT able to penetrate a cell - used as vector for delivering attached
 PT components, e.g. nucleic acid or antigen, to cells, useful in gene
 PT therapy and vaccination
 XX PS Example 2; Page 20; 36pp; French.
 XX CC This sequence corresponds to a peptide derived from the complementary
 CC determining region 2 (CDR2) of an immunoglobulin IgG2a protein and is
 CC used in the production of a polypeptide that (i) comprises a unique or
 CC repeated peptide motif; (ii) includes a sequence consisting of one or
 CC more different antibody fragments and (iii) can penetrate into cells.
 CC The polypeptides are vectors for delivering a substance to cells
 CC (in vivo, in vitro or ex vivo), particularly for use as pharmaceutical
 CC (gene therapy, or where the substance is an antigen, for vaccination,
 CC in which case the polypeptide acts effectively as an adjuvant).

 XX PT New membrane permanent peptide complexes for medical imaging,
 XX diagnostics and therapy
 XX PS Claim 3; Page 17; 65pp; English.
 XX CC The present invention describes compound comprising a cell membrane
 CC permeant peptide, a diagnostic or an active substance and a functional
 CC linker moiety linking them, where the functional linker moiety confers
 CC target cell specificity to the compound or a salt of the compound. The
 CC compounds and compositions are useful in the fields of medical imaging,
 CC diagnostics and pharmaceutical therapy. The composition are for medical
 CC imaging, evaluating intracellular processes, radiotherapy of
 CC intracellular targets and drug delivery. The cell membrane permeant
 CC peptides conjugate coordination and covalent complexes have target cell

CC specificity, therefore, the Tat peptide and other cell membrane permeant
 CC peptides can be used to selectively deliver non- or poorly permeant
 CC drugs, diagnostic substances such as oligonucleotides, peptides, peptide
 CC nucleic acids, fluorochromes, dyes, enzyme substrates and metals useful
 CC in medical therapy, imaging and/or diagnostics selectively to cells
 CC in vivo only when functional linkers are introduced into permeant peptide
 CC constructs. The present sequence represents a specifically claimed
 CC cell membrane permeant peptide from the present invention.

XX
PT Novel monoclonal antibody against human high-affinity IgE receptor -
PT and DNA fragment encoding the MAb, for the specific identification
PT of human Fc-epsilon RI

XX
PS Claim 3; Page 13; 20pp; Japanese.

XX
CC Polypeptides which specifically recognise human IgE receptor (Fc-
CC epsilon-RI) have been isolated and sequenced. The new peptides are
CC related to a monoclonal antibody against Fc-epsilon-RI and are
CC either heavy or light chain molecules. The heavy chain molecules
CC have the general formula FRI-CDRIH-FR2-CDR2H-FR3-CDR3H-FR4 (corresp.
CC to R79153, R79155, R79157, R79159 and R79161) and are encoded by
CC Q96280, Q96282, Q96284, Q96286 and Q96288. FR1 is a polypeptide
CC having 29-36 amino acids (aa), FR2 is a 10-16 aa polypeptide, FR3 is
CC a 33-35 aa polypeptide and FR4 is a 12-14 aa polypeptide. Similarly
CC the light chains have the general formula FR5-CDRL1-FR6-CDR2L-FR7-
CC CDR3L-FR8, (corresp. to R79154, R79156, R79158, R79160 and R79162)
CC and are encoded by Q96281, Q96283, Q96285, Q96287 and Q96289. FR5
CC is a 23-28 aa polypeptide, FR6 is a 14-16 aa polypeptide, FR7 is a
CC 30-34 aa polypeptide and FR8 is a 9-11 aa polypeptide. All the
CC peptides are derived from mouse hybridoma cells and are useful in
CC the detection of the human Fc-epsilon-RI or for the elucidation of
CC an antigen recognising region of a monoclonal antibody against
CC human Fc-epsilon-RI.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

 XX Production of humanized mouse monoclonal antibodies
 XX Disclosure; Page 52-53; 55pp; English.

This sequence represents the heavy chain variable region of murine
 monoclonal antibody LM609. LM609 is directed to integrin
 alpha-v beta-3. It selectively promotes apoptosis of vascular
 cells that have been stimulated to undergo angiogenesis, making it
 a tool for cancer diagnosis and therapy. The invention provides
 humanised antibodies, especially humanised LM609. In such humanized
 antibodies, a light chain CDR from a mouse antibody such as LM609 is
 grafted onto a human light chain, and a heavy chain CDR from a mouse
 antibody is grafted onto a human antibody heavy chain to produce
 CC libraries from which a humanised murine antibody having the desired
 CC specificity is selected. By preserving the original CDR sequences
 CC such as the HCDR3 and LCDR3 sequences of LM609 (see Y06371-72), the
 CC humanisation strategy ensures epitope conservation.

XX Disclosure; Page 51; 55pp; English.

XX
XX This sequence represents the heavy chain variable region of a
CC humanised LM609 antibody. LM609 is directed to human integrin
CC alpha-v beta-3. It selectively promotes apoptosis of vascular
CC cells that have been stimulated to undergo angiogenesis, making it
CC a tool for cancer diagnosis and therapy. The invention provides
CC humanised antibodies, especially humanised LM609. In such humanized
CC antibodies, a light chain CDR from a mouse antibody such as LM609 is
CC grafted onto a human light chain, and a heavy chain CDR from a mouse
CC antibody is grafted onto a human antibody heavy chain to produce
CC libraries from which a humanised murine antibody having the desired
CC specificity is selected. By preserving the original CDR sequences
CC such as the HCDR3 and LCDR3 sequences of LM609 (see Y06371-72), the
CC humanisation strategy ensures epitope conservation.

RESULT 12
T46993
hypothetical protein [Imported] - Yersinia pestis
C:Species: Yersinia pestis
C:Date: 17-Mar-2000 #sequence_revision 17-Mar-2000 #text_change 02-Sep-2000
C:Accession: T46993
R:Buchrieser, C.; Rusniok, C.; Couve, E.; Frangeul, L.; Billault, A.; Kunst, F.; Carn
submitted to the EMBL Data Library, October 1998
A:Description: DNA sequence of the 102 kbases unstable region of Yersinia pestis.
A:Reference number: Z24348
A:Accession: T46993
A>Status: preliminary; translated from GB/EMBL/DBJ
A:Molecule type: DNA
A:Residues: 1-315 <BUC>
A:Cross-references: EMBL:AL031866; PIDN:CAA21336.1
A:Experimental source: strain 6/69
C:Superfamily: outer membrane protein phoE

Query Match 62.7%; Score 37; DB 2; Length 315;
Best Local Similarity 85.7%; Pred. No. 27;
Matches 6; Conservative 1; Mismatches 0; Indels 0; Gaps 0;

PT Humanised antibody, Vitaxin, that binds selectively to alphaVbeta3

PT integrin - and related grafted antibodies based on murine monoclonal
 PT LM609, also related nucleic acid, used to treat, prevent or diagnose
 PT angiogenesis or restenosis
 XX Claim 62; Page 41; 129pp; English.
 XX W76007-W76040 are protein fragments of the grafted monoclonal antibody
 CC LM609 heavy and light chain variable region. LM609 and the antibody
 CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
 CC inhibit binding of alphavbeta3 to a ligand and thus block
 CC integrin-mediated signal transduction. This is useful in the treatment,
 CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
 CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
 CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis, rheumatoid
 CC arthritis, macular degeneration, osteoporosis etc.). The antibodies
 CC contain non-murine framework regions so are suitable for use in humans.
 CC Enhanced types of LM609 have affinity more than 90 times greater than
 CC that of parent the parent antibody.

 XX Humanised antibody, Vitaxin, that binds selectively to alphavbeta3
 PT integrin - and related grafted antibodies based on murine monoclonal
 PT LM609, also related nucleic acid, used to treat, prevent or diagnose
 PT angiogenesis or restenosis
 XX Disclosure; Page 40; 129pp; English.
 XX
 XX W76007-W76040 are protein fragments of the grafted monoclonal antibody

CC LM609 heavy and light chain variable region. LM609 and the antibody
 CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
 CC inhibit binding of alphavbeta3 to a ligand and thus block
 CC integrin-mediated signal transduction. This is useful in the treatment,
 CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
 CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
 CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis, rheumatoid
 CC arthritis, macular degeneration, osteoporosis etc.). The antibodies
 CC contain non-murine framework regions so are suitable for use in humans.
 CC Enhanced types of LM609 have affinity more than 90 times greater than
 CC that of parent the parent antibody.

XX Production of humanized mouse monoclonal antibodies

XX Disclosure; Page 52-53; 55pp; English.

XX This sequence represents the heavy chain variable region of murine
 CC monoclonal antibody LM609. LM609 is directed to integrin
 CC alpha-v beta-3. It selectively promotes apoptosis of vascular
 CC cells that have been stimulated to undergo angiogenesis, making it
 CC a tool for cancer diagnosis and therapy. The invention provides
 CC humanised antibodies, especially humanised LM609. In such humanized
 CC antibodies, a light chain CDR from a mouse antibody such as LM609 is
 CC grafted onto a human light chain, and a heavy chain CDR from a mouse
 CC antibody is grafted onto a human antibody heavy chain to produce
 CC libraries from which a humanised murine antibody having the desired
 CC specificity is selected. By preserving the original CDR sequences
 CC such as the HCDR3 and LCDR3 sequences of LM609 (see Y06371-72), the
 CC humanisation strategy ensures epitope conservation.

 XX
 PS Claim 62; Page 43; 129pp; English.
 XX
 XX W76007-W76040 are protein fragments of the grafted monoclonal antibody
 CC LM609 heavy and light chain variable region. LM609 and the antibody
 CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
 CC inhibit binding of alphavbeta3 to a ligand and thus block
 CC integrin-mediated signal transduction. This is useful in the treatment,
 CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
 CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
 CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis, rheumatoid
 CC arthritis, macular degeneration, osteoporosis etc.). The antibodies
 CC contain non-murine framework regions so are suitable for use in humans.
 CC Enhanced types of LM609 have affinity more than 90 times greater than
 CC that of parent the parent antibody.

 XX Humanised antibody, Vitaxin, that binds selectively to alphavbeta3
 PT integrin - and related grafted antibodies based on murine monoclonal
 PT LM609, also related nucleic acid, used to treat, prevent or diagnose
 PT angiogenesis or restenosis
 XX
 PS Claim 62; Page 41; 129pp; English.
 XX
 XX W76007-W76040 are protein fragments of the grafted monoclonal antibody
 CC LM609 heavy and light chain variable region. LM609 and the antibody
 CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
 CC inhibit binding of alphavbeta3 to a ligand and thus block
 CC integrin-mediated signal transduction. This is useful in the treatment,
 CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
 CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
 CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis, rheumatoid
 CC arthritis, macular degeneration, osteoporosis etc.). The antibodies
 CC contain non-murine framework regions so are suitable for use in humans.
 CC Enhanced types of LM609 have affinity more than 90 times greater than
 CC that of parent the parent antibody.

XX Humanised antibody, Vitaxin, that binds selectively to alphaVbeta3

PT integrin - and related grafted antibodies based on murine monoclonal
 PT LM609, also related nucleic acid, used to treat, prevent or diagnose
 PT angiogenesis or restenosis
 XX
 PS Claim 62; Page 41; 129pp; English.
 XX
 CC W76007-W76040 are protein fragments of the grafted monoclonal antibody
 CC LM609 heavy and light chain variable region. LM609 and the antibody
 CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
 CC inhibit binding of alphavbeta3 to a ligand and thus block
 CC integrin-mediated signal transduction. This is useful in the treatment,
 CC prevention and diagnosis of alphavbeta3-mediated disease, specifically,
 CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
 CC angiogenesis and restenosis of alphavbeta3-mediated disease, specifically
 CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis, rheumatoid
 CC arthritis, macular degeneration, osteoporosis etc.). The antibodies
 CC contain non-murine framework regions so are suitable for use in humans.
 CC Enhanced types of LM609 have affinity more than 90 times greater than
 CC that of parent the parent antibody.

XX :Humanised antibody, Vitaxin, that binds selectively to alphaVbeta3
 PT integrin - and related grafted antibodies based on murine monoclonal
 PT LM609, also related nucleic acid, used to treat, prevent or diagnose
 PT angiogenesis or restenosis

XX Claim 43; Fig 2a; 129pp; English.

XX This sequence represents the LM609 antibody variable heavy chain region.
 CC LM609 and the antibody vitaxin bind selectively to integrin alphavbeta3
 CC and can be used to inhibit binding of alphavbeta3 to a ligand and thus
 CC block integrin-mediated signal transduction. This is useful in the
 CC treatment, prevention and diagnosis of alphavbeta3-mediated disease,
 CC specifically angiogenesis and restenosis (but also e.g. (non-)immune
 CC inflammation, diabetic retinopathy, neovascular glaucoma, cancer,
 CC psoriasis, rheumatoid arthritis, macular degeneration, osteoporosis
 CC etc.). The antibodies contain non-murine framework regions so are
 CC suitable for use in humans. Enhanced types of LM609 have affinity more
 CC than 90 times greater than that of parent the parent antibody.

XX Production of humanized mouse monoclonal antibodies

XX Disclosure; Page 52-53; 55pp; English.

XX This sequence represents the heavy chain variable region of murine
 CC monoclonal antibody LM609. LM609 is directed to integrin
 CC alpha-v beta-3. It selectively promotes apoptosis of vascular
 CC cells that have been stimulated to undergo angiogenesis, making it
 CC a tool for cancer diagnosis and therapy. The invention provides
 CC humanised antibodies, especially humanised LM609. In such humanized
 CC antibodies, a light chain CDR from a mouse antibody such as LM609 is
 CC grafted onto a human light chain, and a heavy chain CDR from a mouse
 CC antibody is grafted onto a human antibody heavy chain to produce
 CC libraries from which a humanised murine antibody having the desired
 CC specificity is selected. By preserving the original CDR sequences
 CC such as the HCDR3 and LCDR3 sequences of LM609 (see Y06371-72), the
 CC humanisation strategy ensures epitope conservation.

XX Novel monoclonal antibody against human high-affinity IgE receptor -
 PT and DNA fragment encoding the Mab, for the specific identification
 PT of human Fc-epsilon RI

PS Claim 5; Page 14; 20pp; Japanese.

XX Polypeptides which specifically recognise human IgE receptor (Fc-
 CC epsilon-RI) have been isolated and sequenced. The new peptides are
 CC related to a monoclonal antibody against Fc-epsilon-RI and are
 CC either heavy or light chain molecules. The heavy chain molecules
 CC have the general formula FRI-CDRIH-FR2-CDR2H-FR3-CDR3H-FR4 (corresp.
 CC to R79153, R79155, R79157, R79159 and R79161) and are encoded by
 CC Q96280, Q96282, Q96284, Q96286 and Q96288. FR1 is a polypeptide
 CC having 29-36 amino acids (aa), FR2 is a 10-16 aa polypeptide, FR3 is
 CC a 33-35 aa polypeptide and FR4 is a 12-14 aa polypeptide. Similarly
 CC the light chains have the general formula FR5-CDRIH-FR6-CDR2L-FR7-
 CC CDR3L-FR8, (corresp. to R79154, R79156, R79158, R79160 and R79162)
 CC and are encoded by Q96281, Q96283, Q96285, Q96287 and Q96289. FR5
 CC is a 23-28 aa polypeptide, FR6 is a 14-16 aa polypeptide, FR7 is a
 CC 30-34 aa polypeptide and FR8 is a 9-11 aa polypeptide. All the
 CC peptides are derived from mouse hybridoma cells and are useful in
 CC the detection of the human Fc-epsilon-RI or for the elucidation of
 CC an antigen recognising region of a monoclonal antibody against
 CC human Fc-epsilon-RI.

XX epsilon-RI) have been isolated and sequenced. The new peptides are
XX related to a monoclonal antibody against Fc-epsilon-RI and are
XX either heavy or light chain molecules. The heavy chain molecules
XX have the general formula FR1-CDRIH-FR2-CDRH-FR3-CDRH-FR4 (corresp.
XX to R79153, R79155, R79157, R79159 and R79161) and are encoded by
XX having 29-36 amino acids (aa). FR2 is a 10-16 aa polypeptide, FR3 is
XX a 33-35 aa polypeptide and FR4 is a 12-14 aa polypeptide. Similarly
XX the light chains have the general formula FR5-CDRL-FR6-CDRL-FR7-
XX CDR3L-FR8, (corresp. to R79154, R79156, R79158, R79160 and R79162)
XX and are encoded by Q96281, Q96283, Q96285, Q96287 and Q96289. FR5
XX is a 23-28 aa polypeptide, FR6 is a 14-16 aa polypeptide, FR7 is a
XX 30-34 aa polypeptide and FR8 is a 9-11 aa polypeptide. All the
XX peptides are derived from mouse hybridoma cells and are useful in
XX the detection of the human Fc-epsilon-RI or for the elucidation of
XX an antigen recognising region of a monoclonal antibody against
XX human Fc-epsilon-RI.

XX
XX Humanised, semi-chimeric and chimeric antibodies against human
XX high-affinity IgE receptor - useful medicinally and have low
XX antigenicity in humans
XX Claim 8; Page 15; 26pp; Japanese.
XX
XX The present sequence, the heavy chain variable region of a
XX chimeric human CRA2 antibody (Ab), comprises complementarity
XX determining regions (CDR) from a murine, anti-human high affinity
XX immunoglobulin E (IgE) receptor, monoclonal Ab (MAB). The
XX humanised chimeric MAB can be used to treat or prevent diseases,
XX specifically allergies, associated with the receptor, and has very
XX low antigenicity in humans.

```

PT integrin - and related grafted antibodies based on murine monoclonal
 CC LM609, also related nucleic acid, used to treat, prevent or diagnose
 PT angiogenesis or restenosis
 XX
 PS Claim 62; Page 41; 129pp; English.
 XX W76007-W76040 are protein fragments of the grafted monoclonal antibody
 CC LM609 heavy and light chain variable region. LM609 and the antibody
 CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
 CC inhibit binding of alphavbeta3 to a ligand and thus block
 CC integrin-mediated signal transduction. This is useful in the treatment,
 CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
 CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
 CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis, rheumatoid
 CC arthritis, macular degeneration, osteoporosis etc.). The antibodies
 CC contain non-murine framework regions so are suitable for use in humans.
 CC Enhanced types of LM609 have affinity more than 90 times greater than
 CC that of parent the parent antibody.

XX Production of humanized mouse monoclonal antibodies

XX Disclosure; Page 52-53; 55pp; English.

XX This sequence represents the heavy chain variable region of murine

CC monoclonal antibody LM609. LM609 is directed to integrin
 CC alpha-v beta-3. It selectively promotes apoptosis of vascular
 CC cells that have been stimulated to undergo angiogenesis, making it
 CC a tool for cancer diagnosis and therapy. The invention provides
 CC humanised antibodies, especially humanised LM609. In such humanized
 CC antibodies, a light chain CDR from a mouse antibody such as LM609 is
 CC grafted onto a human light chain, and a heavy chain CDR from a mouse
 CC antibody is grafted onto a human antibody heavy chain to produce
 CC libraries from which a humanised murine antibody having the desired
 CC specificity is selected. By preserving the original CDR sequences
 CC such as the HCDR3 and LCDR3 sequences of LM609 (see Y06371-72), the
 CC humanisation strategy ensures epitope conservation.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT integrin - and related grafted antibodies based on murine monoclonal
PT LM609, also related nucleic acid, used to treat, prevent or diagnose
PT angiogenesis or restenosis
XX
PS Claim 62; Page 41; 129pp; English.
XX
CC W76007-W76040 are protein fragments of the grafted monoclonal antibody
CC LM609 heavy and light chain variable region. LM609 and the antibody
CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
CC inhibit binding of alphavbeta3 to a ligand and thus block
CC integrin-mediated signal transduction. This is useful in the treatment,
CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis, rheumatoid
CC arthritis, macular degeneration, osteoporosis etc.). The antibodies
CC contain non-murine framework regions so are suitable for use in humans.
CC Enhanced types of LM609 have affinity more than 90 times greater than
CC that of parent the parent antibody.

 PS
 XX This sequence represents the heavy chain variable region of murine

CC monoclonal antibody LM609. LM609 is directed to integrin
 CC alpha-v beta-3. It selectively promotes apoptosis of vascular
 CC cells that have been stimulated to undergo angiogenesis, making it
 CC a tool for cancer diagnosis and therapy. The invention provides
 CC humanised antibodies, especially humanised LM609. In such humanized
 CC antibodies, a light chain CDR from a mouse antibody such as LM609 is
 CC grafted onto a human light chain, and a heavy chain CDR from a mouse
 CC antibody is grafted onto a human antibody heavy chain to produce
 CC libraries from which a humanised murine antibody having the desired
 CC specificity is selected. By preserving the original CDR sequences
 CC such as the HCDR3 and LCDR3 sequences of LM609 (see Y06371-72), the
 CC humanisation strategy ensures epitope conservation.

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

 CC -1- FUNCTION: PROBABLE TRANSCRIPTION FACTOR. IT MAY HAVE A ROLE IN
 MYOGENESIS.
 CC -1- SUBUNIT: CAN BIND AS A HETERODIMER WITH PAX3.
 CC -1- SUBCELLULAR LOCATION: NUCLEAR.
 CC -1- ALTERNATIVE PRODUCTS: 2 ISOFORMS; A LONG FORM (SHOWN HERE), AND
 CC A SHORT FORM; ARE PRODUCED BY ALTERNATIVE SPLICING.
 CC -1- DISEASE: RHABDYOYOSARCOMA-2 (RMS2) IS CHARACTERIZED BY A
 CC CHROMOSOMAL TRANSLOCATION T(1;13)(P36;Q14) WHICH INVOLVES PAX7 AND
 CC FOXO1A. THE RESULTING PROTEIN IS A TRANSCRIPTIONAL ACTIVATOR.
 CC -1- SIMILARITY: BELONGS TO THE PAIRED FAMILY OF HOMEOBOX PROTEINS.
 CC -1- SIMILARITY: CONTAINS A PAIRED BOX DOMAIN.

 RP COPPER BINDING.
 RX MEDLINE; 79001617.
 RA Aoyagi Y., Ikenaka T., Ichida F.;
 RT "Copper(II)-binding ability of human alpha-fetoprotein.";

RL Cancer Res. 38:3483-3486(1978).
 CC -1- FUNCTION: SERUM ALBUMIN, THE MAIN PROTEIN OF PLASMA, HAS A GOOD
 CC BINDING CAPACITY FOR WATER, CA⁺⁺, NA⁺, K⁺, FATTY ACIDS, HORMONES,
 CC BILIRUBIN AND DRUGS. ITS MAIN FUNCTION IS THE REGULATION OF THE
 CC COLLOIDAL OSMOTIC PRESSURE OF BLOOD.
 CC -1- SUBCELLULAR LOCATION: EXTRACELLULAR.
 CC -1- TISSUE SPECIFICITY: PLASMA.
 CC -1- DOMAIN: COMPOSED OF THREE HOMOLOGOUS DOMAINS.
 CC -1- SIMILARITY: BELONGS TO THE ALB/AFP/VDB FAMILY.

PT Humanised antibody, Vitaxin, that binds selectively to alphaVbeta3

PT integrin - and related grafted antibodies based on murine monoclonal
 PT LM609, also related nucleic acid, used to treat, prevent or diagnose
 PT angiogenesis or restenosis
 XX
 PS Claim 62; Page 41; 129pp; English.
 XX
 CC W76007-W76040 are protein fragments of the grafted monoclonal antibody
 CC LM609 heavy and light chain variable region. LM609 and the antibody
 CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
 CC inhibit binding of alphavbeta3 to a ligand and thus block
 CC integrin-mediated signal transduction. This is useful in the treatment,
 CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
 CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
 CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis, rheumatoid
 CC arthritis, macular degeneration, osteoporosis etc.). The antibodies
 CC contain non-murine framework regions so are suitable for use in humans.
 CC Enhanced types of LM609 have affinity more than 90 times greater than
 CC that of parent the parent antibody.

XX Production of humanized mouse monoclonal antibodies

PS Disclosure; Page 52-53; 55pp; English.

XX This sequence represents the heavy chain variable region of murine

CC monoclonal antibody LM609. LM609 is directed to integrin
CC alpha-v beta-3. It selectively promotes apoptosis of vascular
CC cells that have been stimulated to undergo angiogenesis, making it
CC a tool for cancer diagnosis and therapy. The invention provides
CC humanised antibodies, especially humanised LM609. In such humanized
CC antibodies, a light chain CDR from a mouse antibody such as LM609 is
CC grafted onto a human light chain, and a heavy chain CDR from a mouse
CC antibody is grafted onto a human antibody heavy chain to produce
CC libraries from which a humanised murine antibody having the desired
CC specificity is selected. By preserving the original CDR sequences
CC such as the HCDR3 and LCDR3 sequences of LM609 (see Y06371-72), the
CC humanisation strategy ensures epitope conservation.

CC This sequence represents the heavy chain variable region of a
 CC humanised LM609 antibody. LM609 is directed to human integrin
 CC alpha-v beta-3. It selectively promotes apoptosis of vascular

CC cells that have been stimulated to undergo angiogenesis, making it
 CC a tool for cancer diagnosis and therapy. The invention provides
 CC humanised antibodies, especially humanised LM609. In such humanized
 CC antibodies, a light chain CDR from a mouse antibody such as LM609 is
 CC grafted onto a human light chain, and a heavy chain CDR from a mouse
 CC antibody is grafted onto a human antibody heavy chain to produce
 CC libraries from which a humanised murine antibody having the desired
 CC specificity is selected. By preserving the original CDR sequences
 CC such as the HCDR3 and LCDR3 sequences of LM609 (see Y06371-72), the
 CC humanisation strategy ensures epitope conservation.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT Humanised antibody, Vitaxin, that binds selectively to alphaVbeta3

PT Integrin - and related grafted antibodies based on murine monoclonal
 PT LM609, also related nucleic acid, used to treat, prevent or diagnose
 PT angiogenesis or restenosis
 XX
 PS Claim 62; Page 41; 129pp; English.
 XX
 CC W76007-W76040 are protein fragments of the grafted monoclonal antibody
 CC LM609 heavy and light chain variable region. LM609 and the antibody
 CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
 CC inhibit binding of alphavbeta3 to a ligand and thus block
 CC integrin-mediated signal transduction. This is useful in the treatment,
 CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
 CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
 CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis, rheumatoid
 CC arthritis, macular degeneration, osteoporosis etc.). The antibodies
 CC contain non-murine framework regions so are suitable for use in humans.
 CC Enhanced types of LM609 have affinity more than 90 times greater than
 CC that of parent the parent antibody.

 PT LM609, also related nucleic acid, used to treat, prevent or diagnose
 PT angiogenesis or restenosis

XX Claim 1; Fig 1a; 129pp; English.

XX CC This sequence represents a fragment of the vitaxin antibody variable
 CC heavy chain region. Vitaxin and the antibody LM609 bind selectively to
 CC integrin alphavbeta3 and can be used to inhibit binding of alphavbeta3
 CC to a ligand and thus block integrin-mediated signal transduction. This is
 CC useful in the treatment, prevention and diagnosis of alphavbeta3-mediated
 CC disease, specifically angiogenesis and restenosis (but also e.g.
 CC (non-)immune inflammation, diabetic retinopathy, neovascular glaucoma,
 CC cancer, psoriasis, rheumatoid arthritis, macular degeneration,
 CC osteoporosis etc.). The antibodies contain non-murine framework regions
 CC so are suitable for use in humans. Enhanced types of LM609 have affinity
 CC more than 90 times greater than that of parent the parent antibody.

 XX Disclosure; Page 52-53; 55pp; English.
 PS This sequence represents the heavy chain variable region of murine

CC monoclonal antibody LM609. LM609 is directed to integrin
 CC alpha-v beta-3. It selectively promotes apoptosis of vascular
 CC cells that have been stimulated to undergo angiogenesis, making it
 CC a tool for cancer diagnosis and therapy. The invention provides
 CC humanised antibodies, especially humanised LM609. In such humanized
 CC antibodies, a light chain CDR from a mouse antibody such as LM609 is
 CC grafted onto a human light chain, and a heavy chain CDR from a mouse
 CC antibody is grafted onto a human antibody heavy chain to produce
 CC libraries from which a humanised murine antibody having the desired
 CC specificity is selected. By preserving the original CDR sequences
 CC such as the HCDR3 and LCDR3 sequences of LM609 (see Y06371-72), the
 CC humanisation strategy ensures epitope conservation.
